Configuring Salesforce Enterprise WSDL File

You must create the **Salesforce enterprise WSDL** file to include in an integration. You then specify this WSDL when creating a Salesforce connection in the Connections page.

To create the Salesforce Enterprise WSDL:

1. **Open** the Web browser and enter the following URL: www.salesforce.com
2. **Log in** to Salesforce.com using a valid username and password.

   You must log in **as an administrator or user with the Modify All Data permission**. Logins are checked to ensure that they are from a known IP address.
3. Under App Setup, Expand Develop and **click API** to display the WSDL download page.
4. If the organization has managed packages installed in the organization, click **Generate Enterprise WSDL.** Salesforce prompts you to select the version of each installed package to include in the generated WSDL or right-click Generate Enterprise WSDL and **save it** to a local directory. In the right-click menu, Internet Explorer users can choose Save Target As, while Mozilla Firefox users can choose Save Link As to save it to the local directory. The Save dialog is displayed.
5. Provide a name for the WSDL file and a location to save the file on your file system, and click **Save**.
